Introduction

- 
- **Physical presence** vs. **tele-presence**
 - *Information and communication technologies* (ICT) have enabled a **virtual space**.
 - People can participate in activities and interact with others *remotely* through **tele-presence** instead of **physical presence**.
 - Time geography (Hägerstrand, 1970)
 - It provides a useful framework to study spatial and temporal aspects of individuals' activities.
 - Activities in the **virtual space** are not well addressed.
 - Limited progress is made to develop a GIS-based operational system.
 - The main objective of this research is to develop an operational time-geographic GIS for representation, analysis, and visualization of human activities in **physical** and **virtual** spaces.

Time Geography

- Hägerstrand (1970) proposed a framework to study the relationships between various constraints and human activities in a space-time context.
- Three key concepts: space-time path (ST path)
space-time prism (ST prism)
potential path area (PPA)

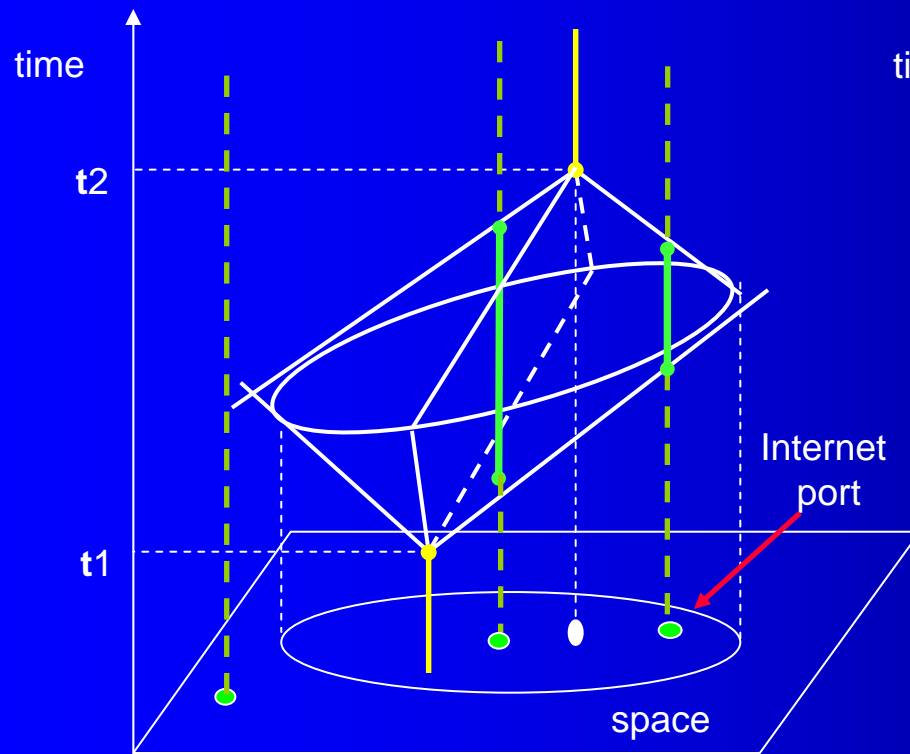

A Conceptual Model for Physical and Virtual Spaces

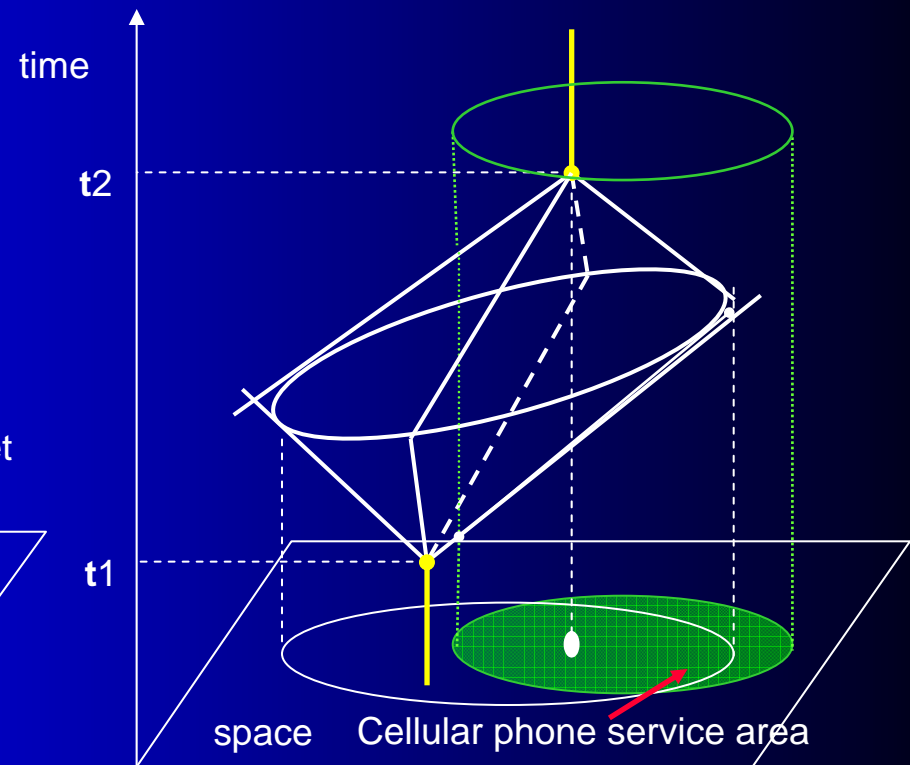

- **Physical space** and **virtual space** have different rules to control activities within their domains.
- In the meantime, the two spaces also intersect with each other.
 - The physical space provides *access channels* to the virtual space.
 - The virtual space feeds back *information* to impact individuals' activities and travel patterns in the physical space.

Space-time Prisms for Virtual Activities

ST Prism for wired access

ST Prism for wireless access

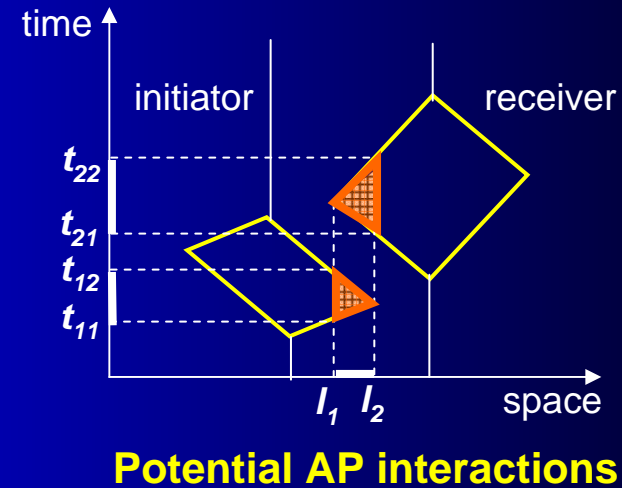

Four Types of Communication Modes

- Four types of communication modes have been identified based on their spatial and temporal characteristics (Janelle, 1995; Harvey and Macnab, 2000; Miller, 2003).

<div>Temporal Spatial</div>	Synchronous	Asynchronous
Physical presence	SP (co-existence) <ul style="list-style-type: none">Face-to-face meeting	AP (co-location in space) <ul style="list-style-type: none">Fridge noteTraditional hospital charts
Tele-presence	ST (co-location in time) <ul style="list-style-type: none">TelephoneOnline chat rooms	AT (no co-location in either space or time) <ul style="list-style-type: none">E-mailWeb pages

(Adapted from Miller, 2003)

Spatio-temporal Relationships of Prisms and Potential Human Interactions

Incorporating Time-geographic Concepts in GIS

- 
- Miller (1991) first brought space-time prism concept into GIS and implemented network-based potential path areas (PPA).
 - Recently, additional efforts have been made to apply time-geographic concepts in GIS (e.g., Kwan and Hong, 1998; Miller 1999; Miller and Wu, 2000; Weber and Kwan, 2002; Kim and Kwan, 2003; Weber 2003).
 - Representation of space-time paths and prisms in GIS remains a research challenge (Yuan et al., 2004), especially for situations of handling both physical and virtual spaces and analysis of interactions among individuals.

A Spatio-temporal GIS Design for the Extended Time-Geographic Framework

- Three-dimensional spatio-temporal features: 2D space + 1D time

An Explicit Representation of Space-time Prisms

- Forward cone/backward cone: the boundary of a prism
 - Represented as *a set of spatio-temporal line features*
- Prism
 - Represented as *a collection of vertical spatio-temporal line features*, which indicate activity opportunities at various locations with explicit time information.

Summary

- Contributions of this study:
 - Extends space-time prism concept to represent potential human activities in both physical and virtual spaces;
 - Develops a spatio-temporal GIS design to accommodate the extended concept by providing functions to compute and visualize space-time prisms in a 3D GIS environment and to support analysis of spatio-temporal relationships among individuals; and
 - Offers an effective approach of dealing with spatio-temporal, individual activity data in a GIS environment.
